Carpet Grade OSB Stair

Risers and treads are mortised into the stair stringers with precision machinery. SturdiStep OSB treads and risers are designed for a carpet grade application. This type of stair is virtually indestructible, yet can easily be carried by 2 to 4 men to its permanent location at the jobsite.

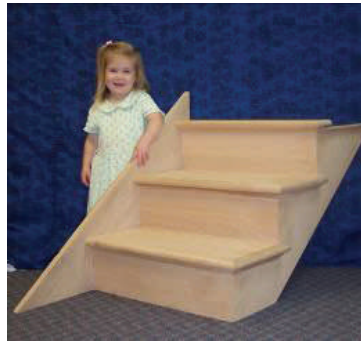

Stain Grade Stair

The two most popular types of stain grade stairs are "Closed" and "Open". A closed stair unit has the risers and treads mortised into the stair stringers with precision machinery in the same fashion as the carpet grade stair.

An open stair is usually wider than a closed stair because the width continues over the supporting wall on at least one side. The stair stringer is mitered to each riser. Each tread sits on top of the stringer and has a mitered return on the end to match the nosing on the front edge of the tread and cover the end grain of the wood.

Stain Grade stairs can be built with virtually any wood species.

Exterior Stair

This is a more recent addition to our family of stair types. We now offer redwood and composite stairs for exterior applications. We use pressure treated lumber for the structural part of the stair and install your choice of composite treads and risers. This type of stair can be a bit heavier to install but we have found a strong demand for them.
